

## Math 501 Homework (§3.2 Limit Theorems)

**Problem 1.** Assume  $X = (x_n) \rightarrow x$  and  $Z = (z_n) \rightarrow z, z \neq 0$ .

**Solution.** Two cases arise:

Case I: There are finitely many  $z_i = 0$ . This implies there is a  $k \in \mathbb{N}$  after which  $z_i \neq 0$ . In other words,  $Z' = (z_n), n > k$  is a tail of  $Z$  that does converge to  $z$ . Hence the quotient sequence  $X/Z$  converges to  $x/z$ .

Case II: There are infinitely many zero- and nonzero-elements in  $Z$ . This means no matter how large a  $k \in \mathbb{N}$ , we can always find a  $z_{i>k} = 0$ . I.e.,  $z_n$  cannot converge. In this case the quotient sequence  $X/Z$  does not exist.
